More on Maximal Ideals

Recall: $(x) \subset \mathbb{Z}[x]$ is prime, but $(x) \subsetneq (2, x)$, so it is not maximal.
 $(x) \in \mathbb{R}[x]$ is maximal because $\mathbb{R}[x]/(x) \cong \mathbb{R}$ is a field

Example 8.1 Let $a \in \mathbb{R}$. We defined the evaluation homomorphism before:

$$\begin{aligned}\text{Ev}_a: \mathbb{R}[x] &\rightarrow \mathbb{R} \\ p(x) &\mapsto p(a)\end{aligned}$$

Observe that Ev_a is in fact surjective. Then

$$\mathbb{R}[x]/\text{Ker}(\text{Ev}_a) \cong \mathbb{R} \implies \text{Ker}(\text{Ev}_a) \text{ is a maximal ideal}$$

Denote $M_a := \text{Ker}(\text{Ev}_a)$

Claim: $M_a = (x - a)$ (e.g. $M_0 = (x)$)

Proof.

If $p(x) \in (x - a)$ then we may write $p(x) = q(x) \cdot (x - a)$, $q(x) \in \mathbb{R}[x]$, then

$$\text{Ev}_a(p(x)) = p(a) = q(a) \cdot (a - a) = 0 \implies p(x) \in M_a \implies (x - a) \subset M_a$$

Conversely, suppose $p(x) \in M_a = \text{Ker}(\text{Ev}_a)$. Let $p(x) = a_0 + a_1x + a_2x^2 + \cdots + a_nx^n$, then you can check with polynomial division that $x - a$ divides $p(x)$ with remainder exactly $p(a)$ which is 0, hence $x - a$ is a factor of $p(x)$ [obviously, if $p(x)$ is a polynomial with a root at $x = a$, then $x - a$ is a factor], and we can write

$$\frac{p(x)}{x - a} = q(x)$$

therefore,

$$p(x) = q(x) \cdot (x - a) \implies p(x) \in (x - a) \implies M_a \subset (x - a)$$

and hence $M_a = (x - a)$. ■

Q: Is every maximal ideal of $\mathbb{R}[x]$ of the form M_a ?

For example, in \mathbb{Z} , the $\{\text{maximal ideals}\} = \{\text{prime ideals}\}$ but we saw above that in $\mathbb{Z}[x]$ there exist prime ideals that are not maximal.

Two standard questions:

- (1) What are the primes?
- (2) What are the maximal ideals?

Claim: Consider $I = (x^2 + 1)$, then $I \subset \mathbb{R}[x]$ is a maximal ideal.

Proof. We have that

$$\mathbb{R}[x] = \{a_0 + a_1x + a_2x^2 + a_3x^3 + \cdots + a_nx^n \mid a_k \in \mathbb{R}, k = 0, 1, 2, \dots, n\}$$

What does $\overline{x^n}$ look like in $\mathbb{R}[x]/(x^2 + 1)$? We can deduce from the zero coset of the

ideal:

$$x^2 + 1 \in (x^2 + 1) \implies \overline{x^2 + 1} = \bar{0} \implies \overline{x^2} = \overline{-1} \in \mathbb{R}[x]/I$$

Furthermore

$$\begin{aligned} x^3 &= x \cdot x^2 \implies \overline{x^3} = \bar{x} \cdot \overline{-1} \in \mathbb{R}[x]/I \\ x^4 &= x^2 \cdot x^2 \implies \overline{x^4} = \overline{-1} \cdot \overline{-1} \in \mathbb{R}[x]/I \end{aligned}$$

Therefore, since all powers of x greater than 2 can be deconstructed into products of -1 and x , we can collapse the cosets of the quotient to a convenient form:

$$\mathbb{R}[x]/I = \{\overline{a_0 + a_1x} \mid a_0, a_1 \in R\}$$

with the rule $\bar{x} \cdot \bar{x} = \overline{-1}$.

This should be familiar and there is a ring isomorphism

$$\begin{aligned} \mathbb{R}[x]/I &\rightarrow \mathbb{C} \\ \bar{1} &\mapsto 1 \\ \bar{x} &\mapsto i \end{aligned}$$

and since the quotient ring is isomorphic to the field \mathbb{C} , I is maximal. ■

Claim: $(x^2 + 1)$ is **not** maximal in $\mathbb{C}[x]$

Proof. We know that $x + i, x - i \in \mathbb{C}[x]$ and

$$(x + i)(x - i) = x^2 + 1 \in (x^2 + 1)$$

But $x + i, x - i \notin (x^2 + 1)$ therefore $(x^2 + 1)$ is not prime in $\mathbb{C}[x]$ and consequently is not maximal. ■

Observe if $a \in R \subset S$ Then

$$\begin{aligned} (a)_R &= \{r \cdot a \mid r \in R\} \\ &\cap \\ (a)_S &= \{s \cdot a \mid s \in S\} \end{aligned}$$

can have different properties as ideals, e.g

$$\begin{aligned} \underbrace{(x) \subset \mathbb{Z}[x]}_{\text{prime}} &\longrightarrow \underbrace{(x) \subset \mathbb{R}[x]}_{\text{maximal}} \\ \underbrace{(x^2 + 1) \subset \mathbb{R}[x]}_{\text{maximal}} &\longrightarrow \underbrace{(x^2 + 1) \subset \mathbb{C}[x]}_{\text{not prime, not maximal}} \end{aligned}$$

The Ring of Fractions

Q: How do we build \mathbb{Q} out of \mathbb{Z} ?

We want to add in multiplicative inverses like $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots$ but we can't just add them in and get a ring.

Consider

$$\mathbb{Z} \times (\mathbb{Z} \setminus \{0\}) = \{(m, n) \mid m, n \in \mathbb{Z}, n \neq 0\}$$

and think of the elements of this set as the fractions $\frac{m}{n}$.

There are some repeats if we care about multiplication and addition like

$$\frac{1}{2} = \frac{2}{4} = \frac{3}{6}$$

We should define an equivalence relation

$$\frac{a}{b} \sim \frac{c}{d} \iff ad = bc$$

e.g. $\frac{4}{6} \sim \frac{6}{9}$ because $4 \cdot 9 = 36 = 6 \cdot 6$.

Definition 8.1: Field of Rational Numbers

The **field of rational numbers** is

$$\mathbb{Q} := \left\{ \frac{m}{n} \mid m, n \in \mathbb{Z}, n \neq 0 \right\} / \sim$$

and this is a field with operations given by

$$\begin{aligned} \frac{a}{b} + \frac{c}{d} &= \frac{ad + bc}{bd} \\ \frac{a}{b} \cdot \frac{c}{d} &= \frac{ac}{bd} \end{aligned}$$

We can also see that there is an injective ring homomorphism

$$\begin{aligned} \mathbb{Z} &\rightarrow \mathbb{Q} \\ n &\mapsto \frac{n}{1} \end{aligned}$$

Claim: If F is a field and there is an injective ring homomorphism

$$f: \mathbb{Z} \rightarrow F$$

Then it factors through \mathbb{Q} , i.e. there is a ring homomorphism

$$\bar{f}: \mathbb{Q} \rightarrow F \text{ such that } f(n) = \bar{f}\left(\frac{n}{1}\right)$$

$$\begin{array}{ccc} \mathbb{Z} & \xrightarrow{i} & \mathbb{Q} \\ & \searrow f & \swarrow \bar{f} \\ & F & \end{array}$$

This is basically saying that if you have an injective homomorphism from \mathbb{Z} to a field F , then under the homomorphism the integers will have inverses $f(2) \cdot \frac{1}{2} \in F$ and one should

see that this is exactly the rationals \mathbb{Q} existing inside F .

Suppose R is any commutative ring with $1 \neq 0$.

Q: Can we do something similar with general rings R ? i.e

$$R \times (R \setminus \{0\}) = \{(r, s) \mid r, s \in R, s \neq 0\}$$

(again, we will write (r, s) as $\frac{r}{s}$). We want to define $r^{-1} = \frac{1}{r}$, $r \neq 0$.

However, if r is a zero divisor, $r \cdot s = 0$ then in this case we want to exclude

$$\frac{1}{r} \cdot \frac{1}{s} = \frac{1}{r \cdot s} = \frac{1}{0}$$

Definition 8.2: Field of Fractions

Let R be an integral domain with $1 \neq 0$. Consider

$$R \times (R \setminus \{0\}) = \{(r, s) \mid r, s \in R, s \neq 0\}$$

Define an equivalence relation (**exercise to show it is**) by

$$\frac{a}{r} \sim \frac{b}{s} \iff a \cdot s = b \cdot r$$

There is no ambiguity in the equality of products since R is integral there are no zero zero divisors, $s, r \neq 0$.

The **field of fractions** of R is

$$Q(R) := R \times (R \setminus \{0\}) / \sim = \left\{ \left[\frac{a}{b} \right] \mid a, b \in R, b \neq 0 \right\}$$

Theorem 8.1

$Q(R)$ is a field with operations

$$\frac{a}{r} + \frac{b}{s} = \frac{as + br}{rs}, \quad \frac{a}{r} \cdot \frac{b}{s} = \frac{ab}{rs}$$

The map

$$i: R \rightarrow Q(R) \\ r \mapsto \frac{r}{1}$$

is an injective ring homomorphism (we say R is a subring of its field of fractions).

Moreover, if F is any field such that $R \subset F$ is a subring (i.e there exists an injective ring homomorphism $f: R \rightarrow F$), then there is a ring homomorphism

$$\bar{f}: Q(R) \rightarrow F \text{ such that } f(x) = \bar{f} \circ i(x)$$

$$\begin{array}{ccc} R & \xrightarrow{i} & Q(R) \\ & \searrow f & \swarrow \bar{f} \\ & F & \end{array}$$

Proof. Think about it.....

■

Example 8.2 $Q(\mathbb{Z}) = \mathbb{Q}$

Example 8.3 $R = \mathbb{R}[x]$ is an integral domain. The fractional field of R is the field of rational functions

$$Q(R) = \mathbb{R}(x) := \left\{ \frac{p(x)}{q(x)} \mid p, q \in \mathbb{R}[x], q \neq 0 \right\}$$

Example 8.4 If R is any integral domain with field of fractions $Q(R) = F$. Consider the integral domain $R[x]$. Then in particular $R \subset R[x]$, and $R[x] \subset Q(R[x])$ which tells us that

$$\begin{array}{ccc} R & \xrightarrow{\text{inclusion}} & Q(R[x]) \\ & \searrow & \nearrow \\ & F & \end{array}$$

e.g $\mathbb{Z} \subset \mathbb{Z}[x]$, so in particular $\mathbb{Q} \subset Q(\mathbb{Z}[x])$.

In fact, since in $Q(\mathbb{Z}[x])$ you've added inverses to the coefficients but you also inverses to the polynomials, so you will get the field of rational functions

$$Q(\mathbb{Z}[x]) = \mathbb{R}(x)$$

Furthermore, this is generally true, as the field of fractions of $R[x]$ is going to be the rational functions with coefficients in the field of fractions of R , i.e

$$Q(R[x]) = F(x)$$
