# L8: Maximal Ideals and Ring of Fractions

**Recall**:  $(X) \subset \mathbb{Z}[X]$  is prime, but  $(X) \subsetneq (2, X)$ , so it not maximal.  $(X) \in \mathbb{R}[X]$  is maximal because  $\mathbb{R}[X]/(X) \cong \mathbb{R}$  is a field

**Example 8.1.** Let  $a \in \mathbb{R}$ . We defined the evaluation homomorphism before:

$$\operatorname{Ev}_a : \mathbb{R}[X] \to \mathbb{R}$$

$$p(X) \mapsto p(a)$$

**Observe** that  $Ev_a$  is in fact surjective. Then

$$\mathbb{R}[X]/\mathrm{Ker}(\mathrm{Ev}_a) \cong \mathbb{R} \implies \mathrm{Ker}(\mathrm{Ev}_a)$$
 is a maximal ideal

Denote the set of polynomials with real coefficients which have a as a root as  $M_a := \text{Ker}(\text{Ev}_a)$ 

<u>Claim:</u>  $M_a = (X - a)$  (e.g  $M_0 = (X)$ )

#### Proof.

If  $p(X) \in (X - a)$  then we may write  $p(X) = q(X) \cdot (X - a)$ ,  $q(X) \in \mathbb{R}[X]$ , then  $\operatorname{Ev}_a(p(X)) = p(a) = q(a) \cdot (a - a) = 0 \implies p(X) \in M_a \implies (X - a) \subset M_a$ 

Conversely, suppose  $p(X) \in M_a = \text{Ker}(\text{Ev}_a)$ . Let  $p(X) = a_0 + a_1 X + a_2 X^2 + \cdots + a_n X^n$ , then you can check with polynomial division that X - a divides p(X) with remainder exactly p(a) which is 0, hence X - a is a factor of p(X) [obviously, if p(X) is a polynomial with a root at X = a, then X - a is a factor], and we can write

$$\frac{p(X)}{X-a} = q(X)$$

therefore,

$$p(X) = q(X) \cdot (X - a) \implies p(X) \in (X - a) \implies M_a \subset (X - a)$$
  
and hence  $M_a = (X - a)$ .

Q: Is every maximal ideal of  $\mathbb{R}[X]$  of the form  $M_a$ ?

For example, in  $\mathbb{Z}$ , the {maximal ideals} = {prime ideals} but we saw above that in  $\mathbb{Z}[X]$  there exist prime ideals that are not maximal.

Two standard questions:

- (1) What are the primes?
- (2) What are the maximal ideals?

**<u>Claim:</u>** Consider  $I = (X^2 + 1)$ , then  $I \subset \mathbb{R}[X]$  is a maximal ideal.

**Proof.** We have that

$$\mathbb{R}[X] = \{a_0 + a_1 X + a_2 X^2 + a_3 X^3 + \dots + a_n X^n | a_k \in \mathbb{R}, k = 0, 1, 2, \dots n\}$$

What does  $\overline{X^n}$  look like in  $\mathbb{R}[X]/(X^2+1)$ ? We can deduce from the zero coset of the ideal:

$$X^2+1\in (X^2+1) \implies \overline{X^2+1}=\overline{0} \implies \overline{X^2}=\overline{-1}\in \mathbb{R}[X]/I$$

Furthermore

$$X^{3} = X \cdot X^{2} \implies \overline{X^{3}} = \overline{X} \cdot \overline{(-1)} \in \mathbb{R}[x]/I$$

$$X^{4} = X^{2} \cdot x^{2} \implies \overline{X^{4}} = \overline{(-1)} \cdot \overline{(-1)} \in \mathbb{R}[X]/I$$

Therefore, since all powers of X greater than 2 can be deconstructed into products of -1 and X, we can collapse the cosets of the quotient to a convenient form:

$$\mathbb{R}[X]/I = \{ \overline{a_0 + a_1 X} \mid a_0, a_1 \in \mathbb{R} \}$$

with the rule  $\overline{X} \cdot \overline{X} = \overline{-1}$ .

This should be familiar and there is a ring isomorphism

$$\mathbb{R}[X]/I \to \mathbb{C}$$
$$\overline{1} \mapsto 1$$
$$\overline{X} \mapsto i$$

and since the quotient ring is isomorphic to the field  $\mathbb{C}$ , I is maximal.

Claim:  $(X^2 + 1)$  is **not** maximal in  $\mathbb{C}[X]$ 

**Proof.** We know that  $X + i, x - i \in \mathbb{C}[X]$  and

$$(X+i)(X-i) = X^2 + 1 \in (X^2 + 1)$$

But  $X + i, X - i \notin (X^2 + 1)$  therefore  $(X^2 + 1)$  is not prime in  $\mathbb{C}[X]$  and consequently is not maximal.

**Observe** if  $a \in R \subset S$  Then

$$(a)_R = \{r \cdot a | r \in R\}$$

$$\cap$$

$$(a)_S = \{s \cdot a | s \in S\}$$

can have different properties as ideals, e.g.

$$\underbrace{(X) \subset \mathbb{Z}[X]}_{\text{prime}} \longrightarrow \underbrace{(x) \subset \mathbb{R}[X]}_{\text{maximal}}$$

$$\underbrace{(X^2+1) \subset \mathbb{R}[X]}_{\text{maximal}} \longrightarrow \underbrace{(X^2+1) \subset \mathbb{C}[X]}_{\text{not prime, not maximal}}$$

## The Ring of Fractions

Q: How do we build  $\mathbb{Q}$  out of  $\mathbb{Z}$ ?

We want to add in multiplicative inverses like  $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \dots$  but we can't just add them in and get a ring.

Consider

$$\mathbb{Z} \times (\mathbb{Z} \setminus \{0\}) = \{(m, n) \mid m, n \in \mathbb{Z}, n \neq 0\}$$

and think of the elements of this set as the fractions  $\frac{m}{n}$ .

There are some repeats if we care about multiplication and addition like

$$\frac{1}{2} = \frac{2}{4} = \frac{3}{6}$$

We should define an equivalence relation

$$\frac{a}{b} \sim \frac{c}{d} \Longleftrightarrow ad = bc$$

e.g  $\frac{4}{6} \sim \frac{6}{9}$  because  $4 \cdot 9 = 36 = 6 \cdot 6$ .

### **Definition 8.1: Field of Rational Numbers**

The field of rational numbers is

$$\mathbb{Q} \coloneqq \left\{ \frac{m}{n} \middle| \ m, n \in \mathbb{Q}, \ n \neq 0 \right\} / \sim$$

and this is a field with operations given by

$$\frac{a}{b} + \frac{c}{d} = \frac{ad + bc}{bd}$$
$$\frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd}$$

We can also see that there is an injective ring homomorphism

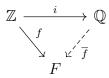

$$\mathbb{Z} \to \mathbb{Q}$$
$$n \mapsto \frac{n}{1}$$

 $\underline{\mathbf{Claim:}}$  If F is a field and there is an injective ring homomorphism

$$f: \mathbb{Z} \to F$$

Then it factors through  $\mathbb{Q}$ , i.e there is a ring homomorphism

$$\overline{f}: \mathbb{Q} \to F \text{ such that } f(n) = \overline{f}\left(\frac{n}{1}\right)$$

This is basically saying that if you have an injective homomorphism from Z to a field F, then under the homomorphism the integers will have inverses  $f(2) \cdot \frac{1}{2} \in F$  and one should

see that this is exactly the rationals  $\mathbb{Q}$  existing inside F.

Suppose R is any commutative ring with  $1 \neq 0$ .

Q: Can we do something similar with general rings R? i.e

$$R \times (R \setminus \{0\}) = \{(r, s) \mid r, s \in R, s \neq 0\}$$

(again, we will write (r, s) as  $\frac{r}{s}$ ). We want to define  $r^{-1} = \frac{1}{r}, r \neq 0$ .

However, if r is a zero divisor,  $r \cdot s = 0$  then in this case we want to exclude

$$\frac{1}{r} \cdot \frac{1}{s} = \frac{1}{r \cdot s} = \frac{1}{0}$$

### Definition 8.2: Field of Fractions

Let R be an integral domain with  $1 \neq 0$ . Consider

$$R \times (R \setminus \{0\}) = \{(r, s) \mid r, s \in R, s \neq 0\}$$

Define an equivalence relation (exercise to show it is) by

$$\frac{a}{r} \sim \frac{b}{s} \Longleftrightarrow a \cdot s = b \cdot r$$

There is no ambiguity in the equality of products since R is integral there are no zero divisors,  $s, r \neq 0$ .

The field of fractions of R is

$$Q(R) := R \times (R \setminus \{0\}) / \sim = \left\{ \left[ \frac{a}{b} \right] \middle| a, b \in R, b \neq 0 \right\}$$

#### Theorem 8.3

Q(R) is a field with operations

$$\frac{a}{r} + \frac{b}{s} = \frac{as + br}{rs}, \qquad \frac{a}{r} \cdot \frac{b}{s} = \frac{ab}{rs}$$

The map

$$i: R \to Q(R)$$
 $r \mapsto \frac{r}{1}$ 

is an injective ring homomorphism (we say R is a subring of its field of fractions). Moreover, if F is any field such that  $R \subset F$  is a subring (i.e there exists an injective ring homomorphism  $f: R \to F$ ), then there is a ring homomorphism

$$\overline{f}: Q(R) \to F \text{ such that } f(x) = \overline{f} \circ i(x)$$

$$R \xrightarrow{i} Q(R)$$

$$\downarrow f$$

**Proof.** Think about it.....

Example 8.2.  $Q(\mathbb{Z}) = \mathbb{Q}$ 

**Example 8.3.**  $R = \mathbb{R}[X]$  is an integral domain. The fractional field of R is the field of rational functions

$$Q(R) = \mathbb{R}(X) := \left\{ \frac{p(X)}{q(X)} \middle| p, q \in \mathbb{R}[X], q \neq 0 \right\}$$

**Example 8.4.** If R is any integral domain with field of fractions Q(R) = F. Consider the integral domain R[X]. Then in particular  $R \subset R[X]$ , and  $R[X] \subset Q(R[X])$  which tells us that

$$R \xrightarrow{\text{inclusion}} F = Q(R)$$

$$Q(R[X])$$

e.g  $\mathbb{Z} \subset \mathbb{Z}[X]$ , so in particular  $\mathbb{Q} \subset Q(\mathbb{Z}[X])$ .

In fact, since in  $Q(\mathbb{Z}[X])$  you've added inverses to the coefficients but you also inverses to the polynomials, so you will get the field of rational functions

$$Q(\mathbb{Z}[X]) = \mathbb{R}(X)$$

Furthermore, this is generally true, as the field of fractions of R[X] is going to be the rational functions with coefficients in the field of fractions of R, i.e

$$Q(R[X]) = F(X)$$
